My name is UMUTONIWASE Alice.

App name:	AUPortfolio
Student:	UMUTONIWASE Alice
Registration number:	25/28026
Verification code:	MOB-A2-8026
Course:	Mobile Application Development (SWE 3409), INES Ruhengeri
Platform:	Android APK built with React Native, Expo and TypeScript

Concept

AUPortfolio replaces a paper CV. A recruiter installs the APK, opens it without Expo Go and understands who I am within two minutes. It shows my name first, then my skills, education and two real projects. It works fully offline, so it can be used during a meeting without internet.

Intended recruiter

A recruiter or lecturer at an internship or innovation challenge who views the app on an ordinary Android phone, often briefly and one-handed. They need the name, the main skills and the proof of work quickly, with clear text and large touch targets.

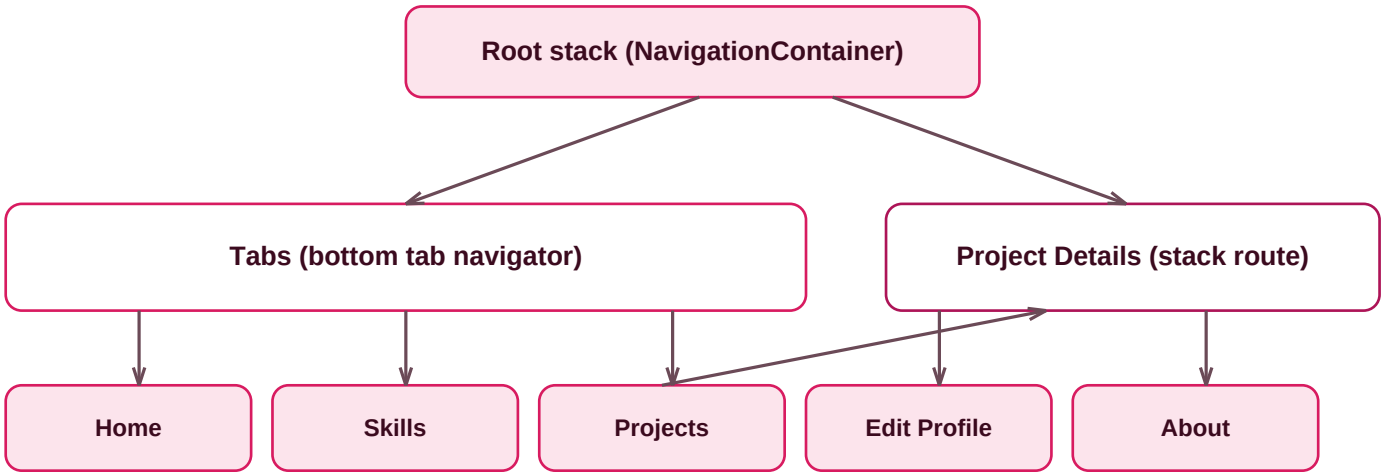
Visual direction

A warm pink identity chosen by me: strong pink (#D81B60) for headers, buttons and the active tab, soft pink (#FCE4EC) for chips and highlights, and a near-white pink background (#FFF8FA). Rounded cards and chips make the app friendly, while dark plum text (#3B0A1E) keeps it professional and readable.

#D81B60 #AD1457 #FCE4EC #FFF8FA #3B0A1E #6B4A57

2. User flow and navigation

Navigation structure



Tapping a project card on the Projects tab opens Project Details and passes the projectId.

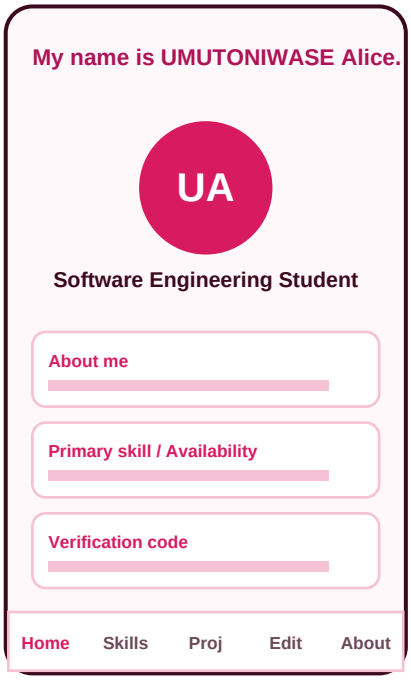
User flows

- **Browse** — Open app > Home ("My name is...") > Skills > Projects.
- **Project detail** — Projects > tap card > Project Details (problem, my contribution, technology) > Android Back returns to the Projects tab with the session kept.
- **Edit profile** — Edit tab > change headline, bio, primary skill or availability > Save. If invalid, field-level messages appear and nothing is saved. If valid, 'Profile saved.' appears and Home updates.
- **Profile photo** — Edit tab > Take photo or Choose from gallery > permission request > preview > Replace or Remove. If permission is denied or the picker is cancelled, a clear message is shown and the current photo is kept.
- **Saved state** — On Save the profile (and photo reference) is written to AsyncStorage. On the next launch the app shows a loader, restores the saved profile, then opens Home. Reset restores the defaults.

Offline

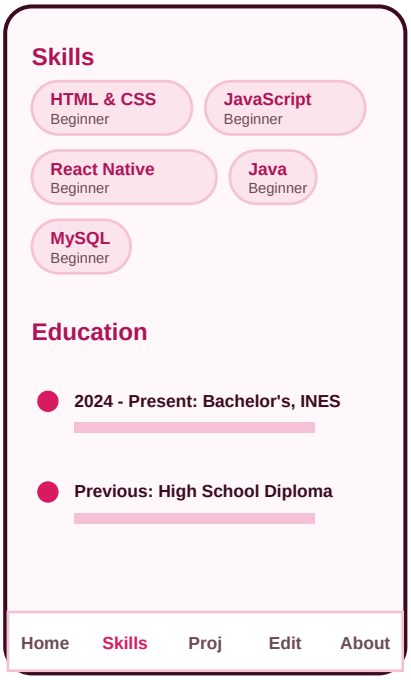
No screen needs internet. All content is in the app or stored on the device, so the whole flow works in Airplane Mode.

3. Annotated wireframes (1 of 2)



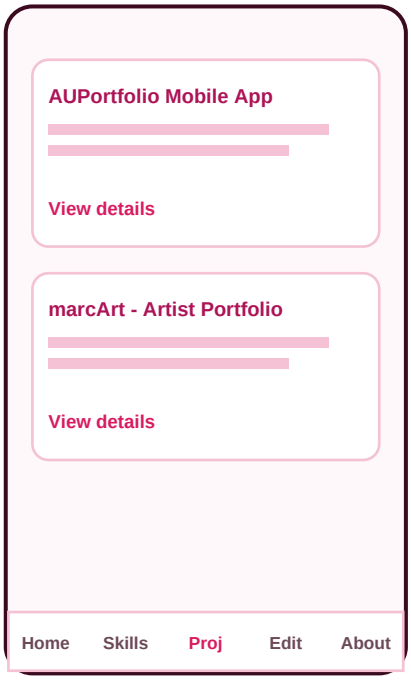
Home

1 Name sentence is the first text on screen (exact wording required). **2 Avatar** shows initials until a photo is chosen. **3 Headline, bio, skill, availability** come from the saved profile. **4 Code** MOB-A2-8026 is visible. Content scrolls for large text.



Skills and education

1 Skill chips (reusable SkillChip) wrap onto new lines with flexWrap, so they never overflow. **2 Timeline** (reusable TimelineItem) lists education. If the list were empty an **EmptyState** message would show.



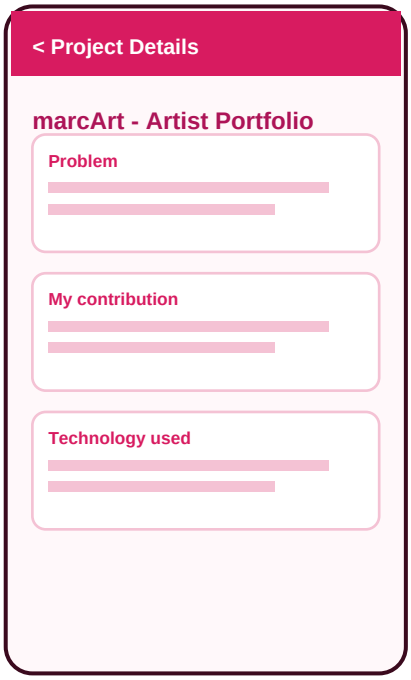
Projects list

1 ProjectCard shows title and problem, with a 'View details' action. **2** Tapping opens the Project Details stack screen and passes only the projectId. An EmptyState is used if there are no projects.

Design notes

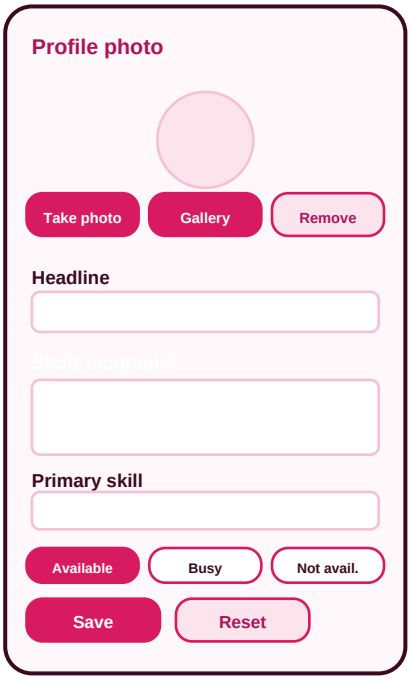
Every screen uses Flexbox and ScrollView with no fixed heights on text, so content grows with the system font size. Cards, chips, timeline items, form fields and the empty state are reusable components used across screens.

4. Wireframes (2 of 2) and states



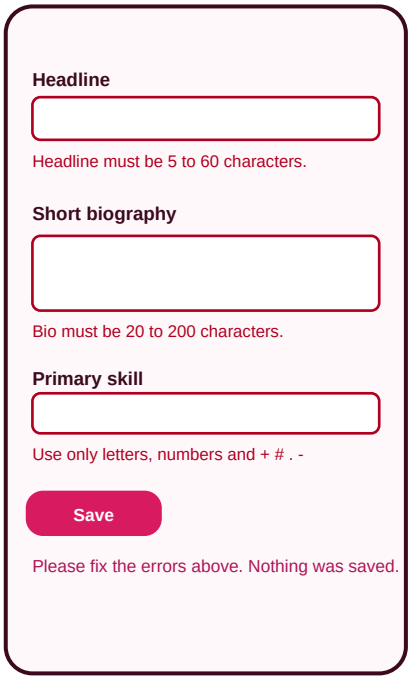
Project Details

1 Header with Back arrow; Android Back also returns to the Projects tab. **2** Three cards: problem, my contribution, technology. Project is found by projectId. 'Project not found' EmptyState if the id is missing.



Profile editor

1 Photo preview with Take, Gallery/Replace and Remove. **2** Controlled inputs for headline, biography, primary skill. **3** Availability options. **4** Save is blocked if validation fails. Reset restores defaults.



Error state (invalid save)

Validation rules: headline 5-60 characters; bio 20-200 characters; primary skill required and limited to letters, numbers and + # . -; an availability status must be chosen. Errors appear under each field in red and the data is not saved.

Other states shown in the app

Empty states: 'No skills added yet.', 'No projects added yet.' and 'Project not found.' use the reusable EmptyState component. **Permission denied:** 'Permission denied. Allow it in phone Settings or choose the other option.' **Cancelled picker:** 'No image selected. Your current photo was kept.' **Success:** 'Profile saved.', 'Profile photo saved.', 'Profile photo removed.' **Loading:** a pink spinner while the saved profile is restored at start-up.

Colour and contrast

White text on the primary pink (#D81B60) has a contrast ratio of about 4.9:1 and is used for bold buttons, headers and the active tab. Body text uses dark plum #3B0A1E on white or #FFF8FA, a very high contrast (above 15:1). Secondary text #6B4A57 on white is about 7.6:1. Errors use #B00020, shown with text and a red border so colour is never the only signal.

Typography

The app uses the Android system font (Roboto) so text follows the user's font settings. Sizes: screen name 24 bold, headline 18 bold, section titles 20 bold, body 16, labels 13 to 15 bold, captions 12. Hierarchy is made with weight and size, not colour alone.

Spacing and layout

Screens use 16 px padding, 12 px between cards, 14 px rounded corners and 10 to 12 px padding inside inputs and buttons. Buttons have at least 10 px vertical padding, giving touch targets close to 44 px. Layouts use Flexbox, ScrollView and flexWrap with no fixed text heights, so they work on a narrow phone.

Accessibility

Buttons, inputs and images have accessibility labels (for example 'Open project marcArt', 'Profile photo'). Headings use the header role. Availability options expose a selected state. Skill chips and timeline items read as one phrase for screen readers. Messages are shown as text near the action.

Large-text behaviour

The app was tested on an itel A200 (Android 15) with the largest system font size. Cards grow with their text, chips wrap onto new lines, and every screen scrolls, so nothing is cut off.

Implementation note

The final screens follow these wireframes. The only change is that the Edit tab includes the photo section at the top so photo and text editing are on one screen.
